

Daily Progress Report - Day 9

Project Name: MediFlow CRM - Doctor / Clinic Practice Management System
Date: September 25, 2026
Developer/Reporter: Group A - Anwesha Manna, Debarati Gantait, Indranil Dutta
Reporting Period: Daily

1. Summary of Today's Activities

Today's work focused on bringing the staff sign-in experience in line with the MediFlow clinic brand while preserving the existing account-based role and permission system. The login flow was refined for desktop and mobile, and the default post-login destination was made aware of each user's available workspace access.

- 1 Login visual design:** Replaced the generic glass-card login with a reference-inspired split screen: warm gradient sign-in panel, dark medical illustration, and a clear coral primary action.
- 2 Responsive form:** Added a compact mobile hero banner and a balanced, vertically flowing sign-in form with accessible labels, browser autofill hints, validation feedback, and a password visibility control.
- 3 Role-based workflow:** Kept role assignment tied to the authenticated staff account. Users without dashboard access now land on the first workspace section their permissions allow; nurses and assistants can proceed to Appointments.
- 4 Security and usability:** Removed prefilled demonstration credentials and quick-login controls. Kept the remember-me option and server-side route permissions as the source of access decisions.

2. Key Discussions & Decisions

A. Role-aware sign-in

Staff continue signing in with their assigned username or email and password. The account's stored role and permissions determine accessible sections; the login page does not let users select or impersonate a role.

B. Responsive visual direction

The new screen carries the reference's split composition and medical illustration on wide screens. On phones, the illustration becomes a short header so the form remains the primary focus and controls do not feel crowded.

C. Permission-based landing

After authentication, the app chooses a workspace route from the user's view permissions, while Laravel's route middleware continues to enforce access. Existing intended destinations are still honored.

3. Individual Contributions & Role Breakdown

Team Member	Role	Key Deliverables & Contributions
Anwesha Manna	Backend & System Architect Lead	Aligned the successful sign-in destination with account permissions and preserved server-side authorization. Added role-landing coverage to the authentication feature tests.
Indranil Dutta	Full-Stack / Clinical Workflow Lead	Reviewed the sign-in flow against staff workflow needs, including remember-me behavior, clear validation feedback, and role-appropriate entry to the clinic workspace.
Debarati Gantait	Frontend, Billing & UI/UX Lead	Designed the responsive login experience, including the split-panel visual system, custom healthcare illustration, mobile layout, keyboard focus states, and password visibility control.

Team member names and roles follow the supplied Group A report format; contributions are organized by their established project roles.

4. Roadblocks & Knowledge Gathering Strategy

Role coverage on first sign-in: The previous shared dashboard redirect could send staff without dashboard permission to a forbidden page. The landing route now checks available view permissions and selects an accessible section.

Signup and password recovery: The supplied visual reference includes Signup and Reset Password links, but the project does not currently expose those routes. They were not shown as active links to avoid presenting unavailable workflows.

Verification status: The Vite production build completed, Laravel Pint passed, and all 7 authentication feature tests passed with 23 assertions. Mobile rendering and password-toggle accessibility were checked in the available browser. The full test suite was not run.

Next focus: Review the desktop layout in the team's Chrome setup, perform role-based acceptance checks for each staff account, and confirm whether account recovery should be implemented as a follow-up feature.
