

Daily Progress Report Day 2

Project Name: MediFlow CRM — Doctor / Clinic Practice Management System

Date: September 15, 2026

Developer/Reporter: Debarati Gantait, Anwesha Manna, Indranil Dutta

Reporting Period: Daily

1. Summary of Today's Activities

Today, the team focused on executing the foundational phases of **MediFlow CRM** based on our approved architectural plan. We scaffolded the Laravel application baseline, established the application layout with responsive navigation, and implemented the core authentication, RBAC (Role-Based Access Control), Settings, and Patients modules. Specifically, we executed the database migrations for Users, Roles/Permissions, Settings, and Patients, implemented the 9-section Patient Profile hub, and built the configurable staff permission engine.

2. Key Discussions & Decisions

A. Architecture & Database Implementation

- **Database Migrations & Schema Execution:** Built and migrated tables for users, roles, permissions, settings, patients, patient_notes, and patient_documents with foreign key constraints, indexes, and soft-deletion/status flags.
- **Granular RBAC & Middleware Enforcement:** Implemented the CheckRoleOrPermission authorization middleware supporting all 6 staff roles (**Admin / Doctor, Clinic Manager, Receptionist, Nurse / Assistant, Accountant, Other Staff**) and the 22 configurable module permissions. Enforced default denial on sensitive operations (delete, system settings, subaccount management).
- **Patient Module & 9-Section Profile Hub:** Standardized the patient schema to accommodate both demographics (Basic Information: 11 fields) and clinical data (Medical Information: 7 fields). Implemented the 9-section tabbed patient profile interface (Personal Information, Medical History, Appointment History, Consultation History, Prescriptions, Invoices, Payments, Notes, Documents/Attachments) to serve as the unified medical hub.
- **Practice Settings Repository:** Developed the centralized settings engine supporting Doctor Profile, Clinic Settings (working hours, consultation fees, currency), Appointment rules (slot duration, daily caps), Prescription defaults, and Invoice numbering.

B. Frontend & UI/UX Development

- **Responsive Layout & Mobile Drawer:** Developed the master Blade layout adhering strictly to Section 15 of the specification: fixed collapsible sidebar for desktop/laptop, off-canvas slide-out drawer for mobile/tablet, and a top navigation bar with quick user actions and notification trigger.

- **Patient Search & Dynamic Filters:** Built patient search capabilities across Patient ID, Name, Phone, and Email, combined with demographic filters (Gender, Age, Registration Date, Last Visit).
- **Medical Document Attachments:** Configured secure, authenticated document upload and file streaming in non-public storage (storage/app/patient_documents/) supporting PDF, JPEG, and PNG formats with file-type and size validation.

3. Members Role

Team Member	Assigned Role	Module & Responsibility Breakdown
Indranil Dutta (<i>Backend & Database</i>)	Backend Architecture & Database Lead	• Created and executed database migrations for users, roles_permissions, settings, and patients • Implemented User Authentication, password updates, session management, and CheckRoleOrPermission middleware • Developed the Practice Settings repository (Doctor Profile, Clinic parameters, Appointment constraints) • Built Patient CRUD controllers, Form Request validations, and search/filter query scopes
Anwesha Manna (<i>Full-Stack / Clinical Workflow Lead</i>)	Clinical Engine & Workflow Specialist	• Designed and implemented the 9-section tabbed Patient Profile Blade interface • Built Patient Notes logging and Patient Medical Documents upload/download engine • Drafted the schema and business validation rules for the upcoming Appointments module (slot durations, break times, daily limits) • Created clinical intake form blueprints for consultation encounter logging (Symptoms, Diagnosis, Notes, Treatment)
Debarati Gantait (<i>Frontend, Billing & Reporting Lead</i>)	Billing, Analytics & UI/UX Lead	• Built the master responsive Blade layout featuring desktop sidebar, mobile drawer, and top header bar • Developed the Patient List UI with responsive table-to-card transformation for mobile devices • Implemented reusable medical status badges, flash notification banners, and modal dialog components • Outlined database migration blueprints and calculation logic for Invoices, Line Items, and Multi-Mode Payments

4. Roadblocks & Knowledge Gathering Strategy

- **Area of Focus:** Ensuring smooth client-side tab switching in the 9-section Patient Profile without full-page reloads, and handling responsive table-to-card transformations smoothly on small touchscreens.
- **Action Taken:** Utilized lightweight Alpine.js state handling for instant tab transitions while keeping data scoped to modular Blade partials; applied responsive CSS grid utility classes to convert tabular patient columns into stacked touch-friendly card units on mobile viewports.
