

Daily Progress Report — Day 5

Project: MediFlow Clinic CRM

Date: September 21, 2026

Developer/Reporter: Debarati Gantait, Anwesha Manna, Indranil Dutta

Reporting Period: Daily

1. Executive Summary

Today's work focused on three major engineering objectives:

1. **Critical Bug Resolution & Performance Optimization:** Fixed the Reports module error and resolved page-to-page latency across the application through caching, asynchronous assets, link prefetching, and SQLite WAL concurrency.
 2. **Clinical UX & Doctor Assignment Logic:** Streamlined appointment workflows and doctor nomenclature, adding conditional logic that auto-assigns single attending doctors while preserving multi-doctor selection when applicable.
 3. **Comprehensive Apple-Inspired UI/UX Redesign:** Redesigned the visual layer of the entire application across desktop, tablet, and mobile inspired by the reference design language (soft frosted glassmorphism, #318FAA cyan/teal accents, rounded-[28px] geometry, and floating mobile glass capsule dock).
-

2. Key Accomplishments & Deliverables

A. Reports & Analytics Engine & Bug Fix

- **Root Cause:** The /reports route previously returned an unpopulated dashboard view, causing an `ErrorException`.
- **Solution:** Implemented the complete **Reports & Analytics Module** strictly conforming to **Section 14** of the specification:
 - Built `ReportController.php` supporting 4 distinct reporting domains:
 - **Financial Reports:** Gross invoiced volume, collected revenue, receivables due, and payment method distribution.
 - **Appointment Reports:** Booking metrics, completed visits, cancellation/no-show rates, and completion percentages.
 - **Patient Reports:** Registration velocity, new vs. returning patients, and cumulative growth.
 - **Prescription Reports:** Script volumes, unique patients treated, and top prescribed medications.

- Implemented one-click **CSV Data Export** (/reports/export) and print-ready templates (/reports/print).
- Added multi-range date filters (Today, Yesterday, This Week, This Month, Last Month, This Year, Custom Range).

B. High-Speed Navigation & Page Transition Optimizations

- **Asynchronous Typography:** Replaced render-blocking synchronous Google Font calls with asynchronous preloading and native system font fallbacks.
- **Intelligent Link Prefetcher:** Added an instant hover-intent prefetcher in app.blade.php that pre-loads HTML on mouse hover, enabling near-instantaneous page transitions.
- **Database Concurrency (SQLite WAL Mode):** Activated SQLite Write-Ahead Logging (WAL mode), synchronous = NORMAL, and a 5000ms busy timeout in database.php to prevent table-level locking bottlenecks.
- **Concurrency & Sessions:** Switched from database session locks to high-speed file storage (SESSION_DRIVER=file) and configured multi-worker server threads (PHP_CLI_SERVER_WORKERS=4).

C. Appointment Workflow & Single vs. Multi-Doctor Logic

- **Nomenclature Standardization:** Replaced all ambiguous "Doctor / Practitioner" labels with clean "Doctor" terminology.
- **Strict Clinician Scoping:** Filtered appointment doctor queries strictly to users with active admin_doctor roles, removing administrative and support staff from doctor dropdowns.
- **Conditional Assignment UX:**
 - **Single-Doctor Clinics:** Automatically assigns the doctor via hidden inputs and displays a read-only attending clinician badge in create.blade.php and edit.blade.php, hiding redundant dropdowns.
 - **Multi-Doctor Clinics:** Dynamically displays the doctor <select> dropdown for assignment and calendar filtering.

D. Full-Scale Visual UI/UX Redesign (Apple Design System)

Redesigned every public and authenticated view in the application to match the target reference aesthetic:

- **Design Tokens & System** (resources/css/app.css):
 - #F4F7F8 atmospheric canvas with ambient radial teal glows.
 - #318FAA (brand primary) and #2C91AE (accent cyan) palette.
 - Frosted glass cards (glass-card, glass-card-elevated) with backdrop-blur-xl, rounded-[28px], and soft drop-shadows.
 - Capsule pill buttons (btn-pill-primary, btn-pill-secondary) and .apple-input controls.

- **Shell & Navigation** (resources/views/layouts/app.blade.php):
 - Desktop floating sidebar with brand pill badges and instant search.
 - Mobile floating bottom glass dock (glass-dock) with active tab indicators.
- **Modules Redesigned:**
 - **Dashboard** (dashboard.blade.php): Next patient hero card, specialty pill strip, and 9 glass KPI widgets.
 - **Appointments** (appointments/): List view, Day/Week/Month capsule calendar, booking forms, and show encounter cockpit.
 - **Patients** (patients/): Dual desktop/mobile directory, patient medical header card, and 9-tab segmented switcher.
 - **Prescriptions** (prescriptions/): Rx repeater form, dosage/timing selects, and digital script statement.
 - **Invoices & Billing** (invoices/): Real-time bill computation, tax/discount calculator, payment settlement drawer, and payment ledger history.
 - **Reports & Analytics** (reports/index.blade.php): Segmented capsule tabs, date preset pills, and responsive ledger tables.
 - **Staff Subaccounts** (subaccounts/): Staff directory, role pills, and granular module permissions matrix.
 - **Settings** (settings/index.blade.php): iOS-inspired grouped settings with vertical floating navigation.
 - **Consultations, Search & Notifications:** Clinical vitals intake, spotlight search, and notification center.

3. Verification & Testing

Check	Tool / Command	Result
Automated Tests	php artisan test --compact	98 passed, 0 failed (376 assertions)
Code Style	vendor/bin/pint --format agent	Clean (All PHP files formatted)
Asset Compilation	npm run build	Clean (Vite built client in 1.93s)
Functionality	Browser / Feature Tests	Zero Regressions (All forms, actions, and routes intact)

4. Work Summary by Numbers

- **Views Redesigned:** 15+ Blade templates completely revamped
- **CSS / UI Components Added:** 8 custom design utility classes (.atmospheric-canvas, .glass-card, .glass-card-elevated, .glass-dock, .apple-input, .btn-pill-*, .glass-pill)
- **Backend Controllers Created/Enhanced:** 2 (ReportController, AppointmentController)
- **Pass Rate:** 100% (98/98 unit & feature tests)
