

Daily Progress Report — Day 7

Project Name: MediFlow CRM — Doctor / Clinic Practice Management System

Date: September 23, 2026

Developer/Reporter: Debarati Gantait, Anwesha Manna, Indranil Dutta

Reporting Period: Daily

1. Summary of Today's Activities

Today, the team focused on executing the **Professional UI/UX Refinement & Visual System Transformation** for **MediFlow Practice CRM**. Following the initial reference integration, our primary objective today was to transition the visual layer from an over-decorated prototype into a **polished, enterprise-grade, clinical SaaS interface**.

We accomplished this without modifying any underlying backend business logic, database schemas, routing, permissions, or existing functional workflows:

- Design System & CSS Token Refinement:** Consolidated design tokens in app.css, toned down excessive GPU-heavy glassmorphism (blur(28px) → performant blur(8px) and blur(12px)), eliminated button-level backdrop blurs, and established a clean border-radius hierarchy across the application.
 - Navigation & Application Shell:** Refactored the desktop sidebar navigation from heavy capsule buttons with circular badges to an elegant left-bar active indicator (border-l-2 border-[#27758F] bg-[#EEF7F9] text-[#1F677E]) with 44px touch targets. Streamlined the desktop topbar, notification panel, and mobile floating glass dock.
 - Practice Dashboard Polish:** Rebuilt the **Doctor Specialty strip** into consistent **icon + label pills**, integrated Dr. Charlotte Adams's **Popular Doctor card** into a cohesive profile layout, divided the **Hero Appointment card** into clear functional zones, and converted all 9 KPI cards into uniform, flat .stat-card elements with zero disruptive scale-jumps on hover.
 - Inner Pages & Forms Standardization:** Standardized tables, filter toolbars, and KPI strips across Appointments, Patients, Invoices, Prescriptions, Subaccounts, and Settings.
 - Build, Style & QA Verification:** Executed Vite compilation (npm run build completed in 2.67s), ran Laravel Pint code formatting audits, and confirmed that all **98 feature and unit tests pass with 376 assertions**.
-

2. Key Discussions & Decisions

A. Design Token Consolidation & Restrained Glassmorphism

- Elimination of Visual Noise:** Identified that heavy backdrop-filter: blur(28px) across every card and button degraded GPU performance and clashed with a clean clinical aesthetic. Reduced blur values

to 8px on .glass-card workhorse containers and 12px on .glass-card-elevated surfaces, backed by high-opacity (90%–96%) backgrounds with subtle borders (#E2EDF1).

- **Intentional Border-Radius Hierarchy:** Replaced the previous "everything is a giant pill or bulbous balloon" design with an intentional scale:
 - **Cards & Table Containers:** rounded-2xl (16px)
 - **Primary & Secondary Buttons:** rounded-xl (10–12px)
 - **Input Fields & Dropdowns:** rounded-[10px]
 - **Status Tags & Micro-badges:** Compact pill (rounded-full)

B. Component Architecture & Usability Improvements

- **Doctor Specialty Strip:** Upgraded from icon-only circular buttons to full **icon + label pills** (Neurologist, Dental, Orthopedic, Cardiology, General Practice) with clear active, hover, and focus-visible states to ensure accessibility and readability.
- **Popular Doctor Featured Card:** Re-architected into a unified, balanced component where clinician credentials, rating (4.9 star badge), specialization, favorite action, and portrait image form a single cohesive card.
- **Hero Appointment Card:** Segmented into three distinct functional zones: **Doctor Identity Zone** (avatar, name, specialization), **Metadata Zone** (date, time, location), and **Actions Zone** (Reschedule and Join Now CTAs).
- **Table Container Architecture:** Extracted a unified .table-container class ensuring consistent white backgrounds, subtle border dividers, and proper horizontal overflow management across all data tables.

C. Backend Stability & Functional Integrity

- **Scope Guarantee:** Zero changes made to controllers, models, migrations, authentication policies, or route definitions.
- **Preservation of Conditional Logic:** Confirmed doctor filtering in appointments remains properly conditional (@if(\$doctors->count() > 1)), automatically hiding unnecessary dropdowns in single-doctor setups.

3. Individual Contributions & Role Breakdown

Team Member	Role	Key Deliverables & Contributions
Anwesh Manna (Backend & System Architect Lead)	Architecture & Backend Integrity Lead	• Audited full route map and controller bindings to guarantee zero backend regressions during frontend refactoring • Verified SQLite WAL database concurrency and caching

		strategies across all report exports and queues • Maintained test coverage and ran the automated PHPUnit test runner (98/98 tests passing, 376 assertions) • Ensured doctor filter conditional logic in scheduling strictly adheres to clinic constraints
Indranil Dutta (<i>Full-Stack / Clinical Workflow Lead</i>)	Clinical UX & Workflow Specialist	• Refactored the dashboard Hero Appointment card with clear visual zones (Doctor identity, consultation metadata, and direct action triggers) • Upgraded Doctor Specialty filters with accessible icon + text labels for all clinical departments • Standardized the Today's Appointments Queue and Recent Patients directory tables with uniform status badges • Unified Appointments, Prescriptions, and Settings module templates to match the refined design tokens
Debarati Gantait (<i>Frontend, Billing & UI/UX Lead</i>)	UI/UX & Design Systems Lead	• Overhauled app.css design token system, removing redundant glass blurs and enforcing a 16px/12px/10px border-radius hierarchy • Redesigned sidebar navigation with crisp left-accent indicators (border-l-2) and 44px touch targets • Unified Invoices & Billing summary cards, filters toolbar, and data ledger with the new .table-container component • Re-bundled production assets via Vite (npm run build in 2.67s) and executed Laravel Pint code formatting audits

4. Roadblocks & Knowledge Gathering Strategy

- **Area of Focus:** Resolving inconsistent border-radii (rounded-[28px], rounded-[32px]) and inline heavy blurs scattered across 20+ Blade templates without modifying HTML attributes, route bindings, or form inputs.
- **Action Taken:** Developed an automated AST/regex batch normalizer to standardize container radii to rounded-2xl and remove redundant inline backdrop-blur-* tags while preserving all blade directives and CSRF tokens.
- **Next Focus:** Preparing practice deployment configurations, validating multi-role permissions for user acceptance testing (UAT), and finalizing administrative handoff documentation.
