

Daily Progress Report - Day 8

Project Name: MediFlow CRM - Doctor / Clinic Practice Management System
Date: September 24, 2026
Developer/Reporter: Debarati Gantait, Anwesha Manna, Indranil Dutta
Reporting Period: Daily

1. Summary of Today's Activities

Today, work focused on making MediFlow CRM more reliable and easier to use across desktop and mobile. The app shell and dashboard were refined, actions were aligned with the permissions and routes behind them, and placeholder alerts were replaced with stored in-app notifications. Appointment, consultation, billing, and staff-access rules were also tightened.

- 1 Mobile UI and dashboard:** Used the same configured clinic profile image across screen sizes, reduced mobile content crowding, improved horizontal table scrolling, and replaced the static dashboard layout with responsive clinic data and working links.
- 2 Section actions:** Reviewed controls in Dashboard, Appointments, Patients, Prescriptions, Invoices, Reports, Subaccounts, and Settings. Added permission-aware visibility, corrected links that could lead to forbidden pages, and replaced nonfunctional print-page close controls with dependable return links.
- 3 Notifications:** Added database-backed activity alerts, an unread badge, category and read-status filters, mark-read/unread actions, mark-all-read, delete/clear actions, and links that open the related record. New activity alerts cover patient, appointment, consultation, prescription, invoice, and payment events.
- 4 Workflow rules:** Added checks for active appointment doctors, clinic hours and break periods, passed times, daily appointment limits, overlapping slots, valid status transitions, and cancellation permission. Consultations now require a checked-in appointment and prevent duplicate consultation records.
- 5 Billing and staff access:** Limited payments to the outstanding invoice balance, constrained invoice statuses, checked patient-to-record links, protected settings password/session actions, and preserved staff permissions when an update omits the permissions field.

2. Key Discussions & Decisions

A. Permission-aligned controls

Section links and action buttons now reflect the permissions enforced by their routes. Sensitive operations such as appointment cancellation, payment management, settings changes, report export/print, and staff-account changes are checked at the route/controller level as well as in the interface. This reduces avoidable 403 dead ends while keeping server-side authorization in place.

B. Responsive interface and notification behavior

The mobile header uses the same profile image source as desktop, and the dashboard presents live data with compact cards and section-aware links. Notifications are now an in-app feed rather than sample entries. Appointment reminders for the following day and unpaid invoice due reminders are scheduled for 8:00 AM, with duplicate reminders suppressed.

C. Preserve valid clinical and billing workflows

Appointment slots must fit clinic hours without crossing the break, and conflicting appointments for the same doctor are rejected. A consultation no longer changes appointment status just by opening its form; saving a consultation requires check-in. Invoice payments cannot exceed the recorded balance, and linked clinical records must belong to the selected patient.

3. Roadblocks & Knowledge Gathering Strategy

Access mismatch across the UI and backend: Some pages displayed controls whose routes required different or stronger permissions. The route groups, permission model, templates, and controllers were reviewed together; controls were gated to match the related route and sensitive actions received server-side checks.

Notification settings without an active delivery flow: Existing notification toggles were not connected to stored activity alerts or scheduled reminders. A notification table, activity notification class, in-app management actions, and a scheduled reminder command were added. The two new migrations were applied to the local project database.

Verification status: Laravel Pint passed, Blade templates compiled, all 72 routes registered, and the scheduler listed the daily reminder task. The Vite production build completed; it displayed a non-blocking notice that the optional fontaine package is unavailable. The full automated test suite was not run in this session.

Next focus

Run role-based user acceptance checks on desktop and mobile, verify the appointment and billing workflows with project data, and configure the target server's Laravel scheduler runner. The current notification experience is an in-app mobile-responsive feed; browser or operating-system push delivery is not configured.
